## Amendments to the Claims:

Claim 1 (Currently Amended): An isolated glycoprotein comprising the human amino acid primary structure of CD55 and a tumor-specific N-linked glycostructure, wherein said glycoprotein has an apparent molecular weight of about 82 kD and is a glycoprotein present on adenocarcinoma cell line 23132 (DSMZ Accession No. DSM ACC 201) or 3051 (DSMZ Accession No. DSM ACC 270), but not on a normal cell.

Claims 2-3 (Canceled).

Claim 4 (Previously Presented): A process for obtaining a glycoprotein according to claim 1, comprising producing a membrane preparation from cells of the human adenocarcinoma cell line 23132, and obtaining the glycoprotein therefrom by size-exclusion chromatography.

Claims 5-41 (Canceled).

Claim 42 (Previously Presented): A process for obtaining a glycoprotein according to claim 1, comprising producing a membrane preparation from cells of the human adenocarcinoma cell line 23132, and obtaining the glycoprotein therefrom by anion-exchange chromatography.

Claim 43 (Previously Presented): The isolated glycoprotein of claim 1, wherein said glycoprotein, if present on a cell and bound by an antibody that is specific for said glycostructure, results in apoptosis of said cell.

Claim 44 (Canceled).

Claim 45 (New): The isolated glycoprotein of claim 43, wherein binding of said antibody to said glycostructure results in cleavage of cytokeratin 18 in said cell.

Claim 46 (New): The isolated glycoprotein of claim 43, wherein binding of said antibody to said glycostructure results in increased c-myc expression in said cell.

Claim 47 (New): The isolated glycoprotein of claim 43, wherein binding of said antibody to said glycostructure results in decreased topoisomerase IIα expression in said cell.

Claim 48 (New): The isolated glycoprotein of claim 43, wherein binding of said antibody to said glycostructure results in an increase in intracellular Ca<sup>2+</sup> concentration in said cell.

Claim 49 (New): The isolated glycoprotein of claim 43, wherein binding of said antibody to said glycostructure does not induce cleavage of poly(ADP-ribose)-polymerase in said cell.

Claim 50 (New): An isolated glycoprotein comprising a section of the human amino acid primary structure of CD55, wherein said section contains a tumor-specific N-linked glycostructure and said section is a section of a glycoprotein that has an apparent molecular weight of about 82 kD and is a glycoprotein expressed by adenocarcinoma cell line 23132 (DSMZ Accession No. DSM ACC 201), but not by a normal cell.
